

inforMED

Clinical outreach for safe, effective pediatric prescribing

Increasing rates of mental health diagnoses in youth have increased utilization of psychotropic medications, contributing to polypharmacy, uncoordinated care and adverse events.

With Magellan Healthcare's inforMED, you can strategically address these concerns while equipping providers with unbiased information.

Leverage evidence-based algorithms

Advanced algorithms analyze pharmacy, medical and lab claims to uncover non-evidence-based pediatric prescribing patterns and stratify interventions.

Provide personalized clinical outreach

Our residency-trained, board-certified specialty pharmacists collaborate with pediatric providers via telephone and video conferencing, to:

- ✓ Deliver evidence-based care using pediatric and behavioral health pharmacological best practices
- ✓ Expand medication knowledge to improve effectiveness and outcomes
- ✓ Understand complex condition medication needs and lower risks in treating comorbid conditions
- ✓ Improve HEDIS measures, such as antipsychotic metabolic monitoring and medication adherence
- ✓ Close treatment gaps by addressing psychotropic polypharmacy and uncoordinated care

Benefit from comprehensive outcomes reporting

Our dedicated pharmacists provide expert insights into pediatric psychotropic use, medication management and safety, monitoring and adherence, and concurrent prescriptions.

This program is like having an additional pharmacist on my staff helping with drug information questions and overall medication support! – inforMED provider

Reduce inappropriate antipsychotic pediatric polypharmacy up to 19%

Without careful management, the complexities of pediatric polypharmacy can cause serious harm. Contact us at mhcinfo@magellanhealth.com to learn how inforMED ensures children receive safe and effective care while reducing costs.
